This sequence is peptide sequence #1 for epitope ECRTP/DEP-1 ectodomain binding antibody used to modulate angiogenesis, described in the method of the invention.

Note: This sequence for ECRTP/DEP-1 epitope, given in example 4, differs from that given in claim 3 (AAU08802).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                tyrosine phosphatase/density enhanced phosphatase-1 (ECRTP/DEP-1). The antibody has antiinflammatory, antipsoriatic, antirheumatic, antidiabetic, antiinflammatory, antipsoriatic, and osteopathic activities and may be an ECRTP/DEP-1 modulator, ECRTP/DEP-1 dimerisation promoter or antagonist and angiogenesis inhibitor. The purified antibody blocks endothelial migration and proliferation and inhibits angiogenesis in disorders such as inflammatory disorders including immune and non-immune inflammation, chronic articular rheumatism and psoriasis, disorders associated with inappropriate invasion of vessels such as diabetic
A cDNA clone was obtd.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT
                                                                                                                               The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' under the sequences derived from mRNAs with intact 5' under the sequences derived from mRNAs with intact 5' under the sequences derived from mRNAs with intact 5' under the sequences derived from mRNAs with intact 5' under the sequences derived from mRNAs with intact 5' under the sequences derived from mRNAs with intact 5' under the sequences derived from mRNAs with intact 5' under the sequences derived from mRNAs with intact 5' under the sequences derived from mRNAs with intact 5' under the sequences derived from mRNAs with intact 5' under the sequences derived from mRNAs with intact 5' under the sequences derived from mRNAs with intact 5' under the sequences derived from mRNAs with intact 5' under the sequences derived from mRNAs with intact 5' under the sequences derived from mRNAs with intact 5' under the sequences derived from mRNAs with intact 5' under the sequences derived from mRNAs with intact 5' under the sequences derived from mRNAs with intact 5' under the sequences derived from mRNAs with intact 5' under the sequences derived from mRNAs with intact 5' under the sequences derived from mRNAs with intact 5' under the sequences derived from mRNAs with intact 5' under the sequences derived from mRNAs with intact 5' under the sequences derived from mRNAs with intact 5' under the sequences derived from mRNAs under the sequences derived from mRNAs under the sequences derived from mRNAs un
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI; 2000-500381/45.

                          The present sequence is the protein sequence for a human transcription factor. The transcription factor and its coding sequence are useful in the diagnosis, treatment and prevention of diseases associated with altered expression of the transcription factor e.g. cell proliferative, autoimmune/inflammatory, neurological and developmental disorders. A number of specific disorders/diseases are given in the specification,
  Hillman
Azimzai
  capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
   Novel transcription factor polypeptides, used to treat diseases associated with altered activity and expression of TRFX, and to for agents capable of modulating its activity -

The invention relates to novel genes (AAI62752-AAI62961) and proteins (AAM4347-AAM42415) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast
   Homo
   Claim 11;
  Novel plasma membrane associated proteins useful for diagnosing, treating, preventing and/or prognosing disorders related to the proteins, including cancer, immune response and neuronal disorde

Lubmitted (NOV-1992) to the EMBL/GenBank/DDBJ databases.

C -I- FUNCTION: RUBISCO CATALYZES TWO REACTIONS: THE CARBOXYLATION OF D-

RIBULOSE 1,5-BISPHOSPHATE, THE PRIMARY EVENT IN PHOTOSYNTHETIC

CRABON DIOXIDE FIXATION, AS WELL AS THE OXIDATIVE FRAGMENTATION OF

THE PENTOSE SUBSTRATE IN THE PHOTORESPIRATION PROCESS. BOTH

C REACTIONS OCCUR SIMULTANEOUSLY AND IN COMPETITION AT THE SAME

ACTIVE SITE (BY SIMILARITY).

C -I- CATALYTIC ACTIVITY: D-RIBULOSE 1,5-BISPHOSPHATE + CO(2) = 2 3-

C PHOSPHO-D-GLYCERATE + Z-PHOSPHOGLYCOLATE.

C -I- SUBGELLULAR LOCATION: CHLOROPLAST (BY SIMILARITY).

                                                                      ACIDS, AND XENOBIOTICS.

CATALYTIC ACTIVITY: RH + reduced flavoprotein + O(2) - Oxidized flavoprotein + H(2)O.

SUBCELLULAR LOCATION: Membrane-bound. Endoplasmic retic TISSUE SPECIFICITY: EXPRESSED AT HIGH LEVELS IN THE INN THE ADRENAL CORTEX.

SIMILARITY: BELONGS TO THE CYTOCHROME P450 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PF00067; p450;

Natl. Acad. Sci. U.S.A. 98:4658-4663(2001).

-i- FUNCTION: This protein is involved in the repair of mismatches in DNA. It is possible that it carries out the mismatch recognition step. This protein has a weak ATPase activity (By similarity).

-i- SIMILARITY: BELONGS TO THE DNA MISMATCH REPAIR MUTS FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CONFLICT
